MARIS Digital Dictation
Efficient support for you and your team.

What is MARIS Digital Dictation?

Speech is the simplest way to document information. Digital dictation is the leading solution in the field of speech processing. Users can create audio files and send them to transcriptionists for transcription from anywhere. Transcriptionists type directly into the appropriate forms within the documentation system. The proofreading and approval process then begins. Various end devices and integration with the leading hospital information system support the user. Recording a dictation is the fastest way for the user to document information. Without predefined guidelines, there are no restrictions on the structure or scope of the information captured.

Common challenges in hospitals:

The challenges of a digital dictation system lie primarily in the downstream processes. Dictations must be transcribed promptly after they are created. This requires sufficient resources within the transcription service—whether internal or external. Nevertheless, the transcription service often needs to make follow-up inquiries. The user creating the documentation must then re-familiarize themselves with the case and incorporate the information. The resulting additional time required is significant, and the approval timeline for the documentation can be significantly delayed.

How does MARIS support digital dictation?

Dictating staff have access to various dictation technologies that can be used. Wired dictation devices are available alongside traditional mobile devices, as well as iOS devices, for example. MARIS can be connected to or integrated with your HIS. This enables patient-specific dictation recording. The corresponding document can also be created directly from the dictation recording. MARIS offers various options for controlling the transcription process. Dictations can be automatically
or manually assigned target completion times and completion dates. Comprehensive management functions ensure optimal distribution of dictations among transcription staff. The MARIS ReportCenter provides a transparent overview of existing processes in terms of resource utilization and dictation turnaround times. Together, we'll optimize the deployment of your existing staff and create the best possible workflow, from recording to transcription. This saves you money and saves your medical staff time. An existing dictation system, as well as external transcription service providers, can be integrated into the MARIS platform.

What users say:

"The MARIS Healthcare team proved to be the perfect partner throughout the project. Even after the main implementation was complete, we were able to rely fully on our partner's commitments. Collaborative, pragmatic, and solution-oriented—that's what successful collaboration looks like."

Janko Beubler
Director of Tertiary Services
AMEOS Holding AG

What are the benefits for you?

- **Process digitization: No loss of patient data**
- **Utilizing existing infrastructure: Investment security**
- **Less time spent: More time for patients**
- **User-friendly operation: Minimal training time**
- **Digitization of workflows: Reduced susceptibility to errors**
